4 Aside: Online Combinatorial Databases

A  $(v, k, \lambda)$ -difference set in a group G of order v is a subset

$$D = \{d_1, d_2, \dots, d_k\}$$

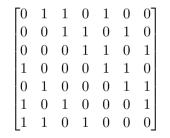

of G such that every nonzero element of G has exactly  $\lambda$  representations as  $d_i - d_j$ .

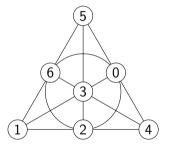

The complement of a  $(v, k, \lambda)$ -DS is a  $(v, v - k, v - 2k + \lambda)$ -DS.

## Example: (7,3,1)-DS = Projective plane of order 2

## Singer Difference Sets

#### More Examples

A Singer difference set has parameters

$$\left(\frac{q^{d+1}-1}{q-1}, \frac{q^d-1}{q-1}, \frac{q^{d-1}-1}{q-1}\right)$$

for d > 1 and q a prime power. Singer constructed them in 1938 using PG(d,q), the projective geometry of dimension d over GF(q).

#### Foreshadowing

The complement of a Singer difference set has parameters

$$\left(\frac{q^{d+1}-1}{q-1}, q^d, q^{d-1}(q-1)\right)$$

## The La Jolla Difference Set Repository

#### **Difference Sets**

A  $(v_i k_j \lambda)$ -difference set in a group G is a subset  $D = \{d_{i_1}, d_{j_2}, ..., d_k\}$  of G such that each nonzero element of G can each be represented as a difference  $(d_i - d_i)$  in exactly  $\lambda$  different ways.

This page gives information about possible parameters for difference sets in abelian groups G. All parameters with v:100000 passing basic tests (counting, schutzenberger, BRC) are listed here, and an attempt has been made to include all known difference sets. Most known for large v are Paley, which are easily constructed, so those are omitted for v:1000.

Some constructions have not been included yet. If you have any difference sets or nonexistence results not in this database, or find any errors, please let me know. The Multiplier Conjecture link below has information about recent computations for v<0^h.

### Group Rings

For a group G, the group ring  $\mathbb{Z}[G]$  is the free  $\mathbb{Z}\text{-module}$  with basis G:

$$\mathbb{Z}[G] = \left\{ \sum_{g \in G} a_g g \mid a_g \in \mathbb{Z} \right\}.$$

## Group Ring Operations

$$A + B = \left(\sum_{g \in G} a_g g\right) + \left(\sum_{g \in G} b_g g\right) = \sum_{g \in G} (a_g + b_g)g$$
$$AB = \left(\sum_{g \in G} a_g g\right) \left(\sum_{h \in G} b_h h\right) = \sum_{g,h \in G} a_g b_h(gh)$$
$$A^{-1} = \sum_{g \in G} a_g g^{-1}$$

## Definition II

Let 
$$D = \sum_{d_i \in D} d_i$$
. D is a difference set if:

$$DD^{-1} = k + \lambda(G - 1_G),$$

## Example

$$G=\mathbb{Z}_7,\ D=g^1+g^2+g^4$$

$$DD^{-1} = (g^1 + g^2 + g^4)(g^6 + g^5 + g^3)$$
  
= 3g<sup>0</sup> + g<sup>1</sup> + g<sup>2</sup> + g<sup>3</sup> + g<sup>4</sup> + g<sup>5</sup> + g<sup>6</sup>

# Related object: Circulant Weighing Matrices

## Definition

A circulant weighing matrix CW(n,k) is an  $n\times n$  cyclically symmetric  $(0,\pm 1)\text{-matrix}\;M$  such that

$$MM^T = kI_n.$$

### Example: CW(7,4)

$$\begin{bmatrix} -& +& +& 0& +& 0& 0\\ 0& -& +& +& 0& +& 0\\ 0& 0& -& +& +& 0& +\\ +& 0& 0& -& +& +& 0\\ 0& +& 0& 0& -& +& +\\ +& 0& +& 0& 0& -& +\\ +& +& 0& +& 0& 0& -\end{bmatrix}$$

## CWM Group Ring Equation

 $C=\sum c_g g$  with  $c_g\in\{0,\pm1\}$  , and

$$CC^{-1} = k.$$

### Facts about CWM's

- $k = s^2$  for some positive integer s,
- Let P be the set of +1's, and N the -1's. WLOG  $|P| = (s^2 + s)/2$ , and  $|N| = (s^2 s)/2$
- A CW(n,k) is called *proper* if no translate has all of P and N in a subgroup of  $\mathbb{Z}_n$ .

## Related object: Signed Difference set

#### Signed Difference Set Equation

 $D=\sum a_gg$  with  $a_g\in\{0,\pm1\}$  , and

$$DD^{-1} = k + \lambda(G - 1_G),$$

#### Example: (7, 6, -1)-SDS in $\mathbb{Z}_7$

$$\begin{bmatrix} 0 & + & + & - & + & - & - \\ - & 0 & + & + & - & + & - \\ - & - & 0 & + & + & - & + \\ + & - & - & 0 & + & + & + \\ - & + & - & - & 0 & + & + \\ + & - & + & - & - & 0 & + \\ + & + & - & + & - & - & 0 \end{bmatrix}$$

Let |G| = mn, N a normal subgroup of order n. A  $(m, n, k, \lambda)$ -relative difference set R of G relative to N is a k-element subset such that the differences of distinct elements of R contain every element of  $G \setminus N$  exactly  $\lambda$  times, and none of N.

#### Group Ring Equation

$$RR^{-1} = k + \lambda(G - N),$$

#### Example

$$\{0, 3, 5, 13\}$$
 is a  $(7, 2, 4, 1)$ -RDS in  $\mathbb{Z}_{14}$  relative to  $N = \{0, 7\}$ .

#### Lifting Difference sets

If R is an  $(m, n, k, \lambda)$ -RDS in G relative to N, then G/N contains an  $(m, k, \lambda n)$ -difference set.

#### Example

The (7, 2, 4, 1)-RDS  $\{0, 3, 5, 13\}$  is a lift of the (7, 4, 2)-DS  $\{0, 3, 5, 6\}$  in  $\mathbb{Z}_7$ .

#### Main Question

When does a difference set have a lifting?

### Lifts of (m, m, m)-DS

- These are called *semiregular*
- For p prime, a  $(p^a, p^b, p^a, p^{a-b})$ -RDS exists.
- Semiregular RDS are related to Hadamard matrices.

#### Lifts of (m, m-1, m-2)-DS

- For q a prime power, and any divisor d of q-1, a (q+1, (q-1)/d, q, d)-RDS exists.
- Are there lifts for m-1 not a prime power?

For  $t \in \mathbb{Z}$ , if  $x \mapsto tx$  takes D to D+g for some  $g \in G$ , then t is called a *(numerical) multiplier*.

#### Example

For the (7,3,1) DS  $\{1,2,4\}$ ,  $2D = \{2,4,1\} = D$ .

For  $t \in \mathbb{Z}$ , if  $x \mapsto tx$  takes D to D+g for some  $g \in G$ , then t is called a *(numerical) multiplier*.

#### Example

For the 
$$(7,3,1)$$
 DS  $\{1,2,4\}$ ,  $2D = \{2,4,1\} = D$ .

#### Theorem

If G is abelian, some translate of D is fixed by *all* its multipliers.

#### First Multiplier Theorem

If D is a difference set,  $p > \lambda$  is a prime dividing  $k - \lambda$ ,  $p \not\mid v$ , then p is a multiplier of D.

For  $t \in \mathbb{Z}$ , if  $x \mapsto tx$  takes D to D+g for some  $g \in G$ , then t is called a *(numerical) multiplier*.

#### Example

For the 
$$(7,3,1)$$
 DS  $\{1,2,4\}$ ,  $2D = \{2,4,1\} = D$ .

#### Theorem

If G is abelian, some translate of D is fixed by *all* its multipliers.

#### First Multiplier Theorem

If D is a difference set,  $p > \lambda$  is a prime dividing  $k - \lambda$ ,  $p \not\mid v$ , then p is a multiplier of D.

### Theorem (G., 2020)

Let  $G = \mathbb{Z}_p \times H$ , where gcd(p, |H|) = 1. If a  $(v, k, \lambda)$ -DS exists in G with multiplier  $m, s = ord_H(m)$ , then orbits of  $\langle m^s \rangle$  are (0, h) and  $(\langle i \rangle_o, h)$ , for  $o = ord_p m^s$ .

If D has a o-orbits and b 1-orbits,

$$\begin{aligned} k &= ao + b, \\ b(b-1) &\leq \lambda(|H|-1), \\ a \cdot o(o-1) &\leq \lambda(p-1). \end{aligned}$$

#### Planar Abelian Difference Sets

All (v, k, 1) difference sets with  $k \le 2 \cdot 10^{10}$  have k - 1 a prime power. Peluse showed # non-prime-powers  $\le x$  is  $o(x/\log x)$ .

#### **Biplanes**

The only (v, k, 2) difference sets with  $k \le 10^{10}$  have k = 3, 4, 5, 6, or 9, with at most six exceptions.

#### Triplanes

The only (v, k, 3) difference sets with  $k \le 10^{10}$  have k = 6 or 7, with at most six exceptions.

#### Recall:

Some translate of a DS is fixed by all its numerical multipliers.

For SDS, CWM and RDS, this isn't always true:

#### Theorem

Some translate of a  $(v,k,\lambda)\text{-}\mathsf{SDS}\text{, }CW(v,k)$  or  $(m,n,k,\lambda)\text{-}\mathsf{RDS}$  is fixed by any one of its multipliers.

If gcd(v, k) = 1, then some translate is fixed by *all* its multipliers.

## Multipliers

### Multiplier Facts

- All of the objects in this talk have some kind of multiplier theorem.
- Weaker than difference set theorems.

## **Multipliers**

#### Multiplier Facts

- All of the objects in this talk have some kind of multiplier theorem.
- Weaker than difference set theorems.

### RDS Multiplier Theorem

Let  $\exp(G) = v^*$ , and R be an  $(m, n, k, \lambda)$ -RDS. Let t be a multiplier of the  $(m, k, n\lambda)$ -DS rel prime to v = mn. Let  $k_1|k$ ,  $k_1 = p_1^{e_1} \cdots p_r^{e_r}$ , and  $k_2 = k_1/\gcd(v, k_1)$ . For each  $p_i$ , define

$$q_i = \begin{cases} p_i & \text{if } p_i \text{ does not divide } v \\ l_i & \text{if } v^* = p_i^r u_i, \ \gcd(p_i, u_i) = 1, \ \text{where } l_i \text{ is an integer such that} \\ \gcd(l_i, p_i) = 1 \ \text{and} \quad l_i \equiv p_i^f \pmod{u_i}. \end{cases}$$

If for each i there exists an integer  $f_i$  such that  $q_i^{f_i} \equiv t \pmod{v^*}$ , then t is a multiplier of R.

# Cyclic lifts of nontrivial difference sets

#### Lam, 1977

- Gave conditions for a multiplier of D to be a multiplier of R,
- Many nonexistence results,
- Found all cyclic RDS with  $k \leq 50$ ,
- All are lifts of complements of Singer PG(d,q) difference sets.

d	q	m	n	k	$\lambda$	# inequivalent
2	2	7	2	4	1	1
2	3	13	2	9	3	2
2	4	21	6	16	2	1
4	2	31	2	16	4	2
2	5	31	4	25	5	2
3	3	40	2	27	9	3
2	7	57	6	49	7	2

#### Arasu, Jungnickel, Ma and Pott, 1995

- $\bullet~{\rm Looked}$  at  $(m,2,k,\lambda){\rm -RDS}$
- No such liftings of Singer, Paley, Twin Prime Power and their complements,...

#### Conjecture

Only complements of Singer DS have lifts with n=2

#### Arasu, Dillon, Leung and Ma, 2001

Theorem: A cyclic

$$\left(rac{q^{d+1}-1}{q-1}, n, q^d, rac{q^{d-1}(q-1)}{n}
ight) - RDS$$

exists iff

$$\begin{array}{ll} n \mid (q-1) & q \text{ odd or } d \text{ odd} \\ n \mid 2(q-1) & q \text{ and } d \text{ even} \end{array}$$

This settles the case of lifts of complements of Singer DS.

#### Pott, 1995

- Extended Lam's table to extensions of Singer DS,  $k \leq 64$  for n odd.
- Asked whether any other difference sets have liftings for any n.

## Given a $(m, k, \lambda n)$ -DS:

- Check nonexistence theorems.
- **2** Find its set of multipliers  $M_1$ .
- Solution Find multipliers  $M_2 = \{t_1, t_2, \ldots, t_s\} \subset M$  of R.

• 
$$M = \begin{cases} \langle M_2 \rangle, & \gcd(mn,k) = 1, \\ \langle t \rangle, & \text{else} \end{cases}$$

**\bigcirc** Search for a collection of orbits of M which form an RDS.

Let  $b_i$  be the number of elements of an RDS equal to  $i \mod n$ .

#### Lemma

For a  $(m, n, k, \lambda)$ -RDS with  $d = \operatorname{gcd}(n, m)$ :

$$\sum_{i=0}^{n-1} b_i = k,$$
$$\sum_{i=0}^{n-1} b_i^2 = k + \lambda \cdot (m-d)$$

where  $|b_i| \leq m$ .

# Example: Complement of the (73, 9, 1)-Singer difference set D

## Does the (73, 64, 56)-DS lift to a (73, 7, 64, 8)-RDS?

- 2 is a multiplier of D, so  $M_1 = \langle 2 \rangle_9$
- $M = \langle 2 \rangle_9$  in  $\mathbb{Z}_{511}$
- gcd(73,7) = 1, so  $\mathbb{Z}_{511} = \mathbb{Z}_{73} \times \mathbb{Z}_{7}$ .
- Orbits of M are  $\langle 0 \rangle_1$  and  $\langle o_1 \rangle_9, \ldots \langle o_8 \rangle_9$ .
- $D = \langle 1 \rangle_9$  (or any of the 9-orbits)

## Orbits in the (73, 7, 64, 8)-RDS

## Results

#### Known difference sets with $50 < k \le 256$

- 93 non-Singer-DS-complements, all eliminated except:
  - PG(5,3): (364, 121, 40), n = 5
  - PG(7,2): (255, 127, 63), n = 3, 7
- 8 Singer complements, found all lifts except
  - PG(2,11): (133, 121, 110), n = 5, 10
  - PG(2,13): (183, 169, 156), n = 2, 3, 4, 6, 12
- Some DS parameters are open ((2185, 105, 5), (1561, 105, 7), (1111, 111, 11), ...)
- Some parameters may have other difference sets

### Conjecture

The only nontrivial difference sets with lifts are Singer complements.

#### Recall

A CW(n,k) is an  $n \times n$   $(0,\pm 1)$ -matrix M such that  $MM^T = kI_n$ .

## Theorem (Ang, 2003)

If a cyclic  $(m, n, k, \lambda)$ -RDS exists with m odd and  $n \equiv 2 \pmod{4}$ , then there is a proper CW(mn/2, k).

#### Product construction (Arasu and Seberry, 1998)

If proper  $CW(n_1, k_1)$  and  $CW(n_2, k_2)$  exist with  $gcd(n_1, n_2) = 1$ , then there is a proper  $CW(n_1n_2, k_1k_2)$ .

#### Theorem (Leung and Schmidt, 2011)

For k an odd prime power, there are a finite number of proper CW(n, k).

#### Settled Cases

All proper CW(n, k) are known for k = 2, 3, 4 (and maybe 5).

k	Known Proper $CW(n,k)$
$2^{2}$	<u>2m, 7</u>
$3^{2}$	<u>13</u> , 24, 26
$4^{2}$	14 <i>m</i> , <u>21</u> , <u>31</u> , <u>62</u> , <u>63</u>
$5^{2}$	<u>31</u> , 33, 62, 71, 124, 142

### Types

- <u>RDS</u>
- product construction
- other constructions
- computer search
- RDS & product

#### October 2021 email from Robert Craigen

- Arranged a Zoom meeting to discuss archiving "Hadamardish" material,
- Ideally comprehensive, permanent, up-to-date,...
- Email followups, but no consensus about the "right" way.

#### The discussion had a big impact on my thinking

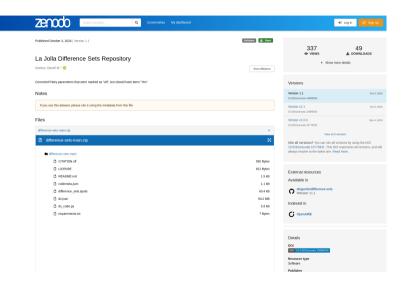

- I worry about my site's permanence,
- Went down many rabbit holes about FAIR data,...
- Mathematics is way behind other disciplines
- Progress is happening, slowly.

#### LJDSR 2.0

- Save data as a json file
- Write basic python or sage code to read, manipulate it in a jupyter notebook,
- Save as a github repo,
- Mirror on zenodo, getting permanence and a DOI.

## Zenodo Mirror
